Libraries needed.

Error Metrics Definitions.

The following lines of code define functions for the calculation of error metrics described in Table 5, Correndo et al. (2021).

```
# Variance (uncorrected, for MSE and its decomposition)
SSx \leftarrow function(x) \{ sum((x - mean(x))^2) / length(x) \}
\# Standard Deviation (uncorrected, for MSE and its decomposition)
sdev <- function(x){sqrt(SSx(x))}</pre>
# Mean Bias Error (Predicted compared to Observed)
MBErr <- function(Obs,Pre){(mean(Pre)-mean(Obs))}</pre>
# Mean Square Error
MSE <- function(Obs,Pre){sum((Obs-Pre)^2)/length(Obs)}</pre>
# Root Mean Square Prediction Error
RMSE <- function(Obs,Pre){sqrt(sum((Obs-Pre)^2)/length(Obs))}</pre>
# Accuracy component of CCC
Xa <- function(Obs,Pre){(2 / (sdev(Pre)/sdev(Obs) +</pre>
                                  sdev(Obs)/sdev(Pre) +
                                  (MBErr(Obs, Pre)^2/(sdev(Pre)*sdev(Obs)))) )}
# Concordance Correlation (Lin,1989), equivalent to r*Xa
CCC <- function(Obs, Pre) {cor(Obs,Pre) * Xa(Obs,Pre)}</pre>
```

Decomposition metrics using SMA.

The following lines of code cover the functions necessary to perform calculations presented in Section 2.5 (Error decomposition using linear regression), Correndo et al. (2021).

```
# Mean Lack of Accuracy (Systematic difference)
MLA <- function(Obs, Pre){sum ((
  Pre - ( (mean(Obs) - (sdev(Obs)/sdev(Pre)*mean(Pre))) +
            sdev(Obs)/sdev(Pre) * Pre))^2) / length(Obs) }
# Mean Lack of Precision (Unsystematic difference)
MLP <- function(Obs, Pre){</pre>
  sum (abs(Obs - ((mean(Obs) - (sdev(Obs)/sdev(Pre)*mean(Pre))) +
                    sdev(Obs)/sdev(Pre) * Pre)) *
         abs(Pre - ((mean(Pre) - (sdev(Pre)/sdev(Obs)*mean(Obs))) +
                      sdev(Pre)/sdev(Obs) * Obs) ) / length(Obs) }
# Kobayashi and Salam (2000) MSE segregation, also in Gupta et al. (2009)
# LCS = MLP; SB + SDSD = MLA
# However, authors consider LCS + SDSD as unsystematic (Mean Square Variation)
# We argue that SDSD is part of the "systematic" component
# Table 3, MLA = SB + SDSD, Correndo et al., (2021)
# Lack of correlation
LCS <- function(Obs, Pre){2 * sdev(Pre) * sdev(Obs) * (1 - cor(Obs, Pre))}
# Square difference between standard deviations
SDSD <- function(Obs, Pre){(sdev(Pre) - sdev(Obs))^2}</pre>
# Square bias
SB <- function(Obs, Pre){(mean(Obs) - mean(Pre))^2}
# Equivalence with Kobayashi and Salam (2000)
# MLA as the sum of SDSD + SB
MLA2 <- function(Obs, Pre){SDSD(Obs, Pre) + SB(Obs, Pre)}
# MLP as LCS
MLP2 <- function(Obs, Pre){ LCS(Obs,Pre) }</pre>
# Theil's partial inequalities, Smith & Rose (1995)
# Proportion of TSS related to mean bias (additive bias, part of PLA)
Ub <- function(Obs,Pre){100*
    (length(Obs)*(mean(Obs)-mean(Pre))^2) / sum((Obs-Pre)^2) }
# Lack of Consistency. Proportion of TSS related to proportional bias (PLA)
Uc <- function(Obs,Pre){100*</pre>
    (length(Obs)*(sdev(Obs)-sdev(Pre))^2) / sum((Obs-Pre)^2) }
# Proportion of TSS related to random error (= PLP)
Ue <- function(Obs,Pre){100*</pre>
    ( 2*length(Obs)* (1-cor(Obs,Pre))*sdev(Pre)*sdev(Obs) ) / sum((Obs-Pre)^2)}
# Equivalence with Smith & Rose (1995)
PLA <- function(Obs,Pre) {Ub(Obs,Pre) + Uc(Obs,Pre)}
PLP <- function(Obs,Pre) {Ue(Obs,Pre)}</pre>
# Percentage additive bias (contribution to MLA)
```

```
PAB <- function(Obs,Pre) {100 * (SB(Obs,Pre)) / MSE(Obs,Pre) }

# Percentage proportional bias (contribution to MLA)

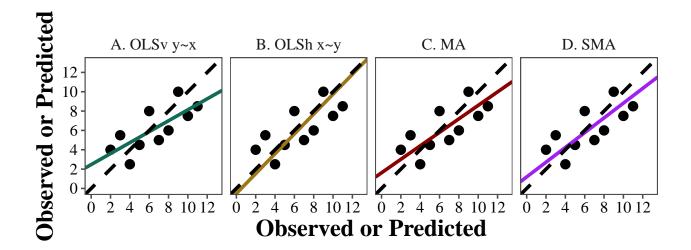

PPB <- function(Obs,Pre) {100 * (SDSD(Obs,Pre)) / MSE(Obs,Pre) }
```

Illustrative dataset. Comparing Regressions.

Simulated dataset provided in Figure 2, Correndo et al. (2021).

```
# Define example dataset
data = data.frame(x = c(2,3,4,5,6,7,8,9,10,11),

Error Decomposition with OLS, MA and SMA.

The following lines of code correspond to the error decompositions proposed in Section 2.5, and in Supplementary material of Correndo et al. (2021). The decompositions include the proposed by Willmott et al. (1981) using OLS, by Duveiller et al. (2006) using MA, and adapted from Ji and Gallo (2006) using SMA linear regressions.

```
# Example 1, Figure 2, Correndo et al. (2021) -Agr. Syst.-
df = data.frame(0_i = c(2,3,4,5,6,7,8,9,10,11),
                P_i = c(4,5.5,2.5,4.5,8,5,6,10,7.5,8.5),
                sim = rep(1)) %>% nest(data=c("0_i", "P_i"))
# Optional, Example 2, Table 9.1, Wallach et al. (2019)
# Remove the "#" to use this dataset
\#df = data.frame(0_i = c(78,110,92,75,110,108,113,155,150),
                P_i = c(126, 126, 126, 105, 105, 105, 147, 147, 147),
#
                 sim = rep(1)) \%\% nest(data=c("0 i", "P i"))
# Estimate linear models and Sum of Unsyst and Syst differences
example = df %>%

APSIM Datasets.

The following four datasets are collections of point forecasts from multiple locations belonging to simulation modules at different stages of their calibration process of APSIM model (Holzworth et al., 2018), described in Table 4, by Correndo et al. (2021).

Disclaimer: The data published here originated from the following GitHub repository: https://github.com/APSIMInitiative/ApsimX. This data has been provided for use for the development of APSIM. Any Improvements to APSIM are owned by the APSIM Initiative and are covered by the terms and conditions which can be accessed here: www.apsim.info.

Note: The next coding lines allow users to read multiple worksheets in a single excel file at once. Users could replace the provided with their own datasets. If the number of new datasets differs from 4, user must change the assigned "id" below

```
# Read the worksheets in a xlsx file
# define the file path
path = "APSIM_datasets.xlsx"
sheet_names = path %>% excel_sheets()
# Read the multiple worksheets
mad = path %>% excel_sheets() %>% set_names(., sheet_names) %>% map(read_excel, path = path)
# Extracting dataframes
# create a tibble of necessary rows (or use the sheet names vector)
# mapping must be done with map using 1:n vector because the data is still under "list" format
APSIM = as.tibble(sheet names) %>%
  rename(., dataset = value) %>%
  mutate(examples = map(seq(1,4,by=1),~as.data.frame(mad[[.]])),
         # Assign "id", UPDATE if removing/adding datasets (as worksheets)
         id = seq(1,4,by=1)
# Unnest and select variables of interest
APSIM = APSIM %>% unnest() %>% dplyr::select(id, dataset, predicted, observed)
# Filtering datasets 1,2,3,4
APSIM_datasets = APSIM %>%
  # ID corresponding to the worksheet order
  filter(id == 1 | id == 2 | id == 3 | id == 4) %>%
  dplyr::select(id, observed, predicted) %>%
  # Renaming observed (O_i) and predicted columns (P_i)
  mutate(0_i = observed, P_i = predicted) %>%
  dplyr::select(id, O_i, P_i) %>% nest(data=c('O_i', 'P_i')) %>%
  # Assing unique letters to the datasets
  mutate(Dataset = rep(c("A", "B", "C", "D"))) %>%
  dplyr::select(-id) %>% arrange(., Dataset)
```

APSIM examples.

Error Metrics.

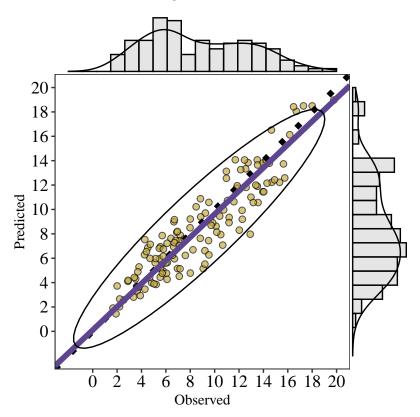

```
APSIM metrics = APSIM datasets %>%
  unnest(cols=c("data")) %% # Unnest observed, predicted values
